Detecting and differentiating between hematopoietic cell proliferative disorders, comprises contacting a target nucleic acid with a reagent that distinguishes between methylated and non-methylated CpG Berlin K, Braun A, Distler J, Guetig D, Howe A, Mueller J; Olek A, Piepenbrock C, Adorjan P, Grabs G, Lesche R, Leu E; Lewin A, Lipscher E, Maier S, Model F, Mueller V, Otto T; Pelet C, Schwope I, Ziebarth H; Claim 15; Page 78; 117pp; English. 26-MAR-2002; 2002WO-BP03401. 26-MAR-2001; 2001US-278333P. (EPIG-) EPIGENOMICS AG. WPI; 2003-018942/01. WO200277272-A2 dimuclectides Homo sapiens. Synthetic. 03-OCT-2002. The invention relates to a method for identifying the presence or absence of a mutation or polymorphism in a plurality of genes. The method is used for identifying the presence or absence of a mutation or polymorphism in subject to the presence or absence of several genetic markers in a subject for diagnosing genetic diseases, e.g. cystic fibrosis, Tay-sachs, camilial hypercholestrolaemia (FH), thalasseamia, sickle cell disease, phenylketomuria, galactosaemia, fragile X syndrome, haemophilia A, myotonic dystrophy, medium-chain acyl CoA dehydrogenase, maturity onset diabetes, cystinuria, methylmolonic acidaemia, urea cycle disorders, thereditary fructose intolerance, hereditary haemachromatosis, neonatal thrombocytopaenia, Gauchers disease, tyrosinaemia, Wilson's disease, alcaptomuria, hypolactasia, Baker's disease, arginihaemia adenomatcous coli (ARC), adult polycystic kidney disease, bochenne muscular dystrophy, alpha-1-antitrypsin deficiency, hereditary non-polyposis colecceal cancer, Huntington's disease, neurofibromatosis, harian's colecceal cancer, Huntington's disease, neurofibromatosis, syndrome, osteogeneeis imperfecta, retinoblastoma, Freidrich's ataxia, haemoglobinopathies, MCAD, Canavan's disease, Leber's hereditary optic neuropathy, retinitis pigmentosas, Bloom syndrome, Panconi's anaemia, or Neimann Pick's disease. The present sequence is human Fragile X gene exon 3 (FragX 3) specific PCR primer used to illustrate the method of Gauchers disease; Canavan's disease; galactosaemia; thrombocytopaemia; thalassaemia; sickle cell disease; phenylketomuria; Marfan's syndrome; haemoglobinopathy; Bloom syndrome; Neimann Pick's disease; PCR; primer; Identifying the presence or absence of a mutation or polymorphism in a subject, useful for diagnosing genetic diseases, comprises generating extension products and analyzing the melting behavior of the mixed DNA Claim 56; Page 42; 49pp; English. The present invention describes a method for detecting and differentiating between haematopoietic cell proliferative disorders associated with at least 1 gene and/or their regulatory regions in a subject. The method comprises contacting a target nucleic acid in a bological sample obtained from the subject with at least 1 reagent, which distinguishes between methylated and non-methylated CpG which distinguishes between methylated and non-methylated CpG the control of 1.0%; Score 13; DB 1; Length 18; 100.0%; Pred. The present invention describes a method for identifying oligonucleotides with desired hybridisation properties to nucleic acid targets containing secondary structure. The method comprises amplifying a target nucleic acid having at least one accessible and one inaccessible site. Primers that form an extension product are identified as the oligonucleotides which can interact with the folded target nucleic acid. Oligonucleotides from the present invention can be used in novel detection methods for clinical diagnostic purposes, including the detection and identification of pathogonic organisms (e.g. HIV). The method allows the ability to rapidly analyse nucleic acid structures. ABL46034 to ABL46367 represent sequences used in the exemplification of the present invention.
                                                                                                                                                                                                                                                                                                                                                      Identifying oligonuclectides hybridizing to nucleic acids containing secondary structure, useful in clinical diagnosis, comprises identifying primers that interact with the target to form an extension product under amplification conditions.

PCR primers AA228411-Z28412 are used to amplify the microsatellite markers associated with the allele situated on chromosome 2, containing the D2S340 locus. The D2S340 microsatellite markers are contained in the region of chromosome 2 containing the IL2 (interleukin 2) cluster of
                                                                                                                                                                                            This invention describes a novel isolated nucleic acid (A) for the Neiseria gonorrhoeae GC-3 sequence. The isolated nucleic acid (A) and fragments of (A) are used for the species-specific detection of services of sequence in standard amplification or hybridization assays. Fragments of (A) are species-specific with no detectable cross-reaction with any other species, so they provide a rapid, reliable and selective fown to 10 genomic copies) diagnosis. AAZ24068-Z24090 represent PCR primers used in the identification of the N. gonorrhoeae GC3 fragment described in the method of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Diagnosing asthma, or an asthmatic predisposition, from the presence of specific alleles at a locus on chromosome 2\,
                                                                                                                     Isolated nucleic acid for the GC-3 fragment from Neisseria gonorrhoeae, useful for species-specific detection
                                                                                                                                                                                                                                                                                                                                                                                                             Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      asthma; predisposition;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      PCR primer UD2S340 used to amplify the D2S340 microsatellite marker.
                                                                                                                                                                                                                                                                                                                                                                                                             ö

genes. The invention relates to a method for diagnosing asthma or a predisposition to asthma. The products of PCR primers AA228409-228418 are used to detect amy alleles that may be connected with asthma. The D2S308*3 allele (PCR primers AA228409-228410 are used to amplify the associated microsatellite markers) is used in the claimed methods to identify children at risk of developing asthma by examination immediately after birth, potentially allowing the disease to be prevented. The methods may also allow a prognosis of the severity of a condition and responses to particular treatments.

Novel membrane proteins, phospholipid scramblase polypeptides, useful for treating and preventing cancer and viral infections, are induced by interferons

Example 8; Page 61; 94pp; English.

The invention provides phospholipid scramblase (PLSCR) polypeptides and polynucleotides encoding them. PLSCR are membrane proteins that mediate accelerated trans-bilayer movement of plasma membrane phospholipids in response to elevated cytoplasmic calcium. The PLSCR polypeptides are useful for inhibiting or preventing viral infection (e.g. infection of a membrane-bound virus or virus such as rhabdovirus, filovirus, retrovirus, flavirus, coronavirus, orthomyxovirus, baramyxovirus, retrovirus, herpesvirus, poxvirus, togavirus, iridovirus, paramyxovirus, aremavirus, HIV, Ebola virus, Marburg virus and Rabies virus). The polynuclectides are useful for treating aviral such as useful for treating a subject having or at risk of having a disorder modulating the PLSCR activity, are useful for treating infection or encourage in a plasma, chronic myelogenous lenkemia, myeloma, melanoma, renal cell lenkemia, chronic myelogenous lenkemia, myeloma, melanoma, renal cell carcinoma, Kaposi's sarcoma, follicular lymphoma, thrombocythemia or erythroleukemia, PLSCR is also useful for treating and preventing cancer. Sequences AMI670194-34 represent human PLSCRI

exon/introm junction sequences.

New polynucleotides regulated by fatty lesion development and their encoded polypeptides, useful for preventing, treating or ameliorating atherosclerosis, as well as for immune or hyperproliferative disorders

Example 2; Page 124; 188pp; English.

The present invention relates to an isolated nucleic acid regulated by fatty lesion development, which comprises any of 55 polymucleotide caquences from Orycolagus cuniculus. The polymucleotide, polypeptide or antibody is useful for preventing, treating, modulating or ameliorating a medical condition, particularly atherosclerosis. The invention is used as marker or detector of nervous system disorder or disease (e.g. Parkinson's disease, Alzheimer's disease, ischaemia, dementia). The invention may also be useful for treating deficiencies or disorders of the immune system (e.g. lymphopsenia, leukocyte adhesion deficiency syndrome or haemoglobinuria, anaemia), hyperproliferative disorders (e.g. daucher's disease), infectious disease (e.g. herpes simplex), coagulation disorders, blood platelet disorders and autoimmune disorders (Addison's disease, rheumatoid arthritis, dermatitis, Grave's disease). The polymuchotide sequence is also used in gene therapy. The present sequence is a 5' RT-PCR primer for rabbit RECI_22 clone.

```

```
The present sequence represents the preferred target sequence for an enzymatic nucleic acid, especially a harmerhead ribozyme, which cleaves the human c-myb sequence at the base position indicated in the descriptor line. The c-myb sequence was screened for optimal ribozyme
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Human c-myb hammerhead ribozyme target sequence (nt. position 2715).
                                                                                                                                     The present sequence represents a preferred target sequence for an enzymatic nucleic acid (i.e. a ribozyme) which cleaves ICAM-1 mERNA at the nucleotide base position indicated in the DE line. Regions of the mRNA that do not form secondary folding structures and that contain potential harmershead and hairpin structures and that contain potential harmershead and hairpin. Ribozymes cleavage sites were identified by computer analysis. Ribozymes directed against these mRNA sequences were designed and synthesised with modifications that improve their nuclease resistance. The ribozymes cleave the ICAM-1 target sequences and thereby inhibit ICAM-1 expression, making them useful for reducing transplant rejection and alleviating symptoms in patients with themmatoid arthritis, asthma and other inflammatory disorders. (Updated on 25-MAR-2003 to correct PI field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             New enzymatic nucleic acid molecules - which cleave RNA produced by e.g. c-myb, for treating restenosis or cancer

which did not form secondary folding algorithm, and regions of the mRNA which did not form secondary folding structures and contained potential ribozyme cleavage sites were identified. Ribozymes were synthesised and their activities optimised by either varying the length of the binding arms or by modification to prevent degradation by nucleases. The ribozymes cleave the c-myb sequence and can be used to prevent smooth muscle cell hyperproliferation in restenosis, especially after coronary angioplasty, and in cancers.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The present invention describes nucleic acid molecules which modulate the synthesis, expression and/or stability of a mRNM encoding 1 or more receptors of vascular endothelial growth factor (VBGF). A patient (preferably human) having a condition associated with the level of the fim-like tyrosine kinase ! (fit-1), kinase innert domain containing receptor (KDR) and/or foetal liver kinase il (fit-1) (e.g. tumour angiogenesis, ocular diseases, psoriasis and rheumatoid arthritis) can be treated by administering the mucleic acid molecule or the expression vector to the patient. AMK67275 to AAX75752 represent specific examples of nucleic acid molecules from the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Vascular endothelial growth factor receptor; VBGF receptor; flt-1; flt.1; KDR; hammerhead ribozyme; haltpin ribozyme; oleavage; tumour angiogenesis; psoriasis; rheumatoid arthritis; ocular disease; fumour tyrosine kinase 1; kinase insert domain containing receptor;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Nucleic acid molecule modulating VEGF receptor(s) gene expression or mRNA stability - useful for treating e.g. tumour angiogenesis, psoriasis, rheumatoid arthritis, etc., in a human patient

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The present invention describes nucleic acid molecules which modulate the synthesis, expression and/or stability of a mRNA encoding 1 or more receptors of vascular endothelial growth factor (VRGF). A patient (preferably human) having a condition associated with the level of the fms-like tyrosine kinase 1 filt-1), kinase insert domain containing receptor (KDR) and/or foetal liver kinase 1 filt-1) (e.g. tumour angiogenesis, ocular diseases, psoriasis and rheumatoid arthritis) can be treated by administering the nucleic acid molecule or the expression vector to the patient. AANS(7275 to AANS7572 represent specific examples of nucleic acid molecules from the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Gaps
                                                                                                                                                                                                                                                                                                     Vascular endothelial growth factor receptor; VEGF receptor; flt-1; flk-1; KDR; hammerhead ribozyme; hairpin ribozyme; cleavage; tumour angiogenesis; psoriasis; rheumatoid arthritis; ocular disease; fms-like tyrosine kinase 1; kinase insert domain containing receptor; foetal liver kinase 1; 88.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Nucleic acid molecule modulating VEGF receptor(s) gene expression or mRNA stability - useful for treating e.g. tumour anglogenesis, psoriasis, rheumatoid arthritis, etc., in a human patient

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The present invention describes nucleic acid molecules which modulate the synthesis, expression and/or stability of a mRNA encoding 1 or more receptors of vascular endothelial growth factor (WEGP). A patient (preferably human) having a condition associated with the level of the fima-like tyrosine kinase 1 (file.1), kinase innest domain containing receptor (KDR) and/or foetal liver kinase 11 (file.1) (e.g. tumour anglogenesis, ocular diseases, psoriasis and rheumatoid arthritis) can be treated by administering the nucleic acid molecule or the expression vector to the patient. AXK67275 to AAX75752 represent specific examples of nucleic acid molecules from the present invention.
                                                                                      Vascular endothelial growth factor receptor; VEGF receptor; flt-1; flk-1; KDR; hammerhead ribozyme; hairpin ribozyme; cleavage; tumour angiogeneals; psoriasis; rheumatoid architius; coular disease; fms-like tyrosine kinase 1; kinase insert domain containing receptor; foetal liver kinase 1; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Vascular endothelial growth factor receptor; VEGF receptor; flt-1; flk-1; KDR; hammerhead ribozyme; hairpin ribozyme; cleavage; tumour angiogenesis; psoriasis; rheumatoid arthritis; ocular disease;
                                                                                                                                                                                                                                                                                                                                                                                                                  Nucleic acid molecule modulating VBGF receptor(s) gene expression or mRNA stability - useful for treating e.g. tumour angiogenesis, psoriasis, rheumatoid arthritis, etc., in a human patient
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                .

the synthesis, expression and/or stability of a mRNA encoding 1 or more receptors of vascular endothelial growth factor (VBGF). A patient (preferably human) having a condition associated with the level of the fms-like tyrosine kinase 1 (flt-1), kinase insert domain containing receptor (KDR) and/or foetal liver kinase 1 (flk-1) (e.g. tumour angiogenesis, ocular diseases, psoriasis and rheumatoid arthritis) can be treated by administering the nucleic acid molecule or the expression vector to the patient. AAK67275 to AAX75752 represent specific examples of nucleic acid molecules from the present invention.
                                                                                                                                                                                                                                                                the present invention describes nucleic acid molecules which modulate
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Vascular endothelial growth factor receptor; VEGF receptor; flt-1; flk-1; XDR; hammerhead ribozyme; hairpin ribozyme; cleavage; tumour angiogenesis; psoriasis; rheumatoid arthritis; ocular disease; fms-like tyrosine kinase 1; kinase insert domain containing receptor; foetal liver kinase 1; se

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ઠે
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ö
                                                                                                                                                                                                                                                                                                                                                                                        The present invention describes nucleic acid molecules which modulate the synthesis, expression and/or stability of a mRNA encoding 1 or more receptors of vascular endothelial growth factor (VR3F). A patient (preferably human) having a condition associated with the level of the fms-like tyrosine kinase 1 (fit-1), kinase insert domain containing receptor (KDR) and/or foetal liver kinase insert domain containing angiogenesis, ocular diseases, psoriasis and rheumatoid arthritis) can be treated by administering the nucleic acid molecule or the expression vector to the patient. AAX67275 to AAX75752 represent specific examples of nucleic acid molecules from the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Vascular endothelial growth factor receptor; VEGF receptor; flt-1; flk-1; KDR; hammerhead ribozyme; hairpin ribozyme; cleavage; tumour angiogenesis; psoriasis; rhemmatoid arthritis; ocular disease; fms-like tyrosine kinase 1; kinase insert domain containing receptor; foetal liver kinase 1; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Gaps
                                                                                                                                                                                                                                               Nucleic acid molecule modulating VEGP receptor(s) gene expression or mRNA stability - useful for treating e.g. tumour angiogenesis, psoriasis, rheumatoid arthritis, etc., in a human patient
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Nucleic acid molecule modulating VEGF receptor(s) gene expression

The present invention describes nucleic acid molecules which modulate the synthesis, expression and/or stability of a mRNA encoding 1 or more receptors of vascular endothelial growth factor (VRGF). A patient (preferably human) having a condition associated with the level of the fms-like tyrosine kinase 1 (fit-1), kinase insert domain containing receptor (KDR) and/or foetal liver kinase 1 (fik-1) (e.g. tumour
                                                                                                                                                           The present invention describes nucleic acid molecules which modulate the synthesis, expression and/or stability of a mRNA encoding 1 or more receptors of vascular endothelial growth factor (WGGF). A patient (preferably human) having a condition associated with the level of the fims-like tyrosine kinase 1 (fit-1), kinase insert domain containing receptor (KDR) and/or foetal liver kinase 1 (fik-1) (e.g. tumour angiogenesis, ocular diseases, psoriasis and rheumatoid arthritis) can be treated by administering the nucleic acid molecule or the expression vector to the patient. AAX67275 to AAX75752 represent specific examples of nucleic acid molecules from the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Vascular endothelial growth factor receptor; VEGF receptor; flt-1; flk-1; KDR; hammerhead ribozyme; hairpin ribozyme; cleavage; tumour angiogenesis; psoriasis; rheumatoid arthritis; ocular disease; fms-like tyrosine kinase 1; kinase insert domain containing receptor; foetal liver kinase 1; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Nucleic acid molecule modulating VEGP receptor(s) gene expression or mRNA stability - useful for treating e.g. tumour anglogenesis, psoriasis, rheumatoid arthritis, etc., in a human patient
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Gaps

Novel hairpin and hammerhead ribozymes are being investigated for their ability to inhibit the activity of a growth factor (e.g. cdc2 kinase) responsible for abnormal smooth muscle cell (SMC) proliferation in vascular tissue leading to restenosis. The ribozymes can also directly block the production of oncogenes and cell regulatory factors involved
anglogenesis, ocular diseases, psoriasis and rheumatoid arthritis) can be treated by administering the nucleic acid molecule or the expression vector to the patient. AAX67275 to AAX75752 represent specific examples of nucleic acid molecules from the present invention.
                                                                                                                                                                                                                                                                                                                         Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        New hairpin and harmer:head ribozyme(s) - which inhibit abnormal smooth muscle cell proliferation in vascular tissue, partic. for preventing or treating restenosis

```
The present invention describes enzymatic nucleic acid molecules with CC RNA-cleaving activity (e.g. ribozymes) which are capable of modulating carpression of plant genes: (i) involved in biosynthesis of alkaloids; or (ii) involved in flower formation. AAV95982 to AAV96334, and AAV96335 to AAV96334 represent potato solanidine glucosyltransferase campa AAV96355 to AAV96734 represent potato solanidine glucosyltransferase target sequences. AAV96773 represent potato solanidine glucosyltransferase target sequences. AAV96773 to AAV97170, and AAV97171 to AAV97195 corpresent potato citrate synthase hammerhead and hairpin ribozymes. respectively. AAV96773 to AAV96772, and AAV97195 to AAV97195 to AAV97195 corpresent potato citrate synthase hammerhead and hairpin ribozymes. CC represent potato citrate synthase hammerhead and hairpin ribozymes. CC represent potato citrate synthase hammerhead and hairpin ribozymes of toxic alkaloids in solanaceous plants, particularly potato but also tomato, pepper, caubergine and ditura or to inhibit flowering in potato, lettuce, spinach, caubergine and ditura or to inhibit flowering in potato, lettuce, spinach, cabbage, bruses practic and turf grass. Also the ribozymes can be used for RNA manipulation in the same way that restriction endonucleases are for DNA, as well as to examine genetic drift and mutations in plants and to detect specific RNA. The ribozymes can be targeted to specific genes or to consensus sequences within a family of related genes, and being corporations.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Gaps

The present invention describes enzymatic nucleic acid molecules with RNA-cleaving activity (e.g. ribozymes) which are capable of modulating the expression of plant genes: (1) involved in bioxymthemis of and Anaybodis or (ii) involved in flower formation. AAV95982 to AAV96334, and AAV963154 represent potato solanidine glucosyltransferase hammerhead and hairpin ribozymes, respectively. AAV96325 to AAV95981, and AAV96325 to AAV96734 represent potato solanidine glucosyltransferase target sequences. AAV9673 to AAV97170, and AAV97171 to AAV97195

ceptesent potato citrate synthase harmerhead and hairpin ribozymes, respectively. AAV96735 to AAV96732, and AAV97196 to AAV97120 represent potato citrate synthase target sequences. Ribozymes of the present cotato citrate synthase target sequences. Ribozymes of the present citrate synthase target sequences. Ribozymes of the present citrate synthase target sequences. Ribozymes of the present citrate synthase target sequences. Ribozymes can didute or to inhibit flowering in potato, lettuce, spinach, cabbage, brussel sprouts, arugula, kale, collard, beet, turnip, sweet potato and turf grass. Also the ribozymes can be used for RNA manipulation in the same way that restriction endomucleases are for DNA, a well as to examine genetic drift and mutations in plants and to the consenus sequences within a family of related genes or to consenus sequences within a family of related genes, and being catalytic need to be present at only very low concentrations. Variants of DNA virus replicating through RNA intermediate, especially hepatitis B - have mutations in genes for DNA polymerase, surface antigen or region of overlapping reading frames, and show reduced sensitivity to antiviral agents or antibodies

Example 3; Page 19; 53pp; English.

This sequence is a PCR primer for DNA encoding a fragment of a Hepatitis b virus (HBV) DNA polymerase. The amplified fragment can be mutated to give the variant of a DNA virus of the invention, that replicates via an RNA intermediate. Detection of mutations in the encoded protein sequence can be used in a method for determining if a HBV isolate has reduced sensitivity to a nucleotide analogue or if its surface antigen (SAG) has reduced interaction with antibodies. Mutations in the DNA polymerase gene indicate (partial) resistance to nucleotide analogues while those in the SAG gene indicate reduced interaction with specific antibodies. Detecting sequences containing these mutations is used to monitor anti-viral treatments (chemotherapy and/or vaccination) and to screen for agents that can overcome the effects of such mutations (potentially useful in long-term treatments with nucleotide analogues).

expression and/or Novel ribozymes for modulating the synthesis, expresstability of an mRNA encoding an angiogenic factors

Claim 56; Page 106; 305pp; English.

Locarnini SA;

The present invention describes enzymatic nucleic acid molecules with RNA cleaving activity, which specifically cleave RNA encoded by an aryl Nydrocarbon nuclear transporter (ARNY) gene, an integrin submuit beta 3 gene, an integrin submuit beta 3 gene, an integrin submuit beta 3 gene, an integrin alpha 6 subunit gene, or a Tie-2 gene. AAA16775 to AAA17167 and AAA1762 to AAA17622 represent ribozyme sequences for ARNY, corresponding target sequences; AAA19185 to AAA19185 and AAA19087 to AAA19184 represent ribozyme sequences for Tie-2, and AAA19185 to AAA19087 to AAA191221 represent their corresponding target sequences; AAA191221 to AAA21601 and AAA21601 and AAA21601 and AAA21601 and AAA21601 corresponding target sequences; AAA21609 to AAA21601 and AAA21601 corresponding target sequences; AAA21609 to AAA21605 and AAA21609 to integrin subunit alpha-6, or integrin subunit beta-3.

Novel ribozymes for modulating the synthesis, expression and/or stability of an mRNA encoding an angiogenic factors

Claim 55; Page 210; 305pp; English.

The present invention describes enzymatic nucleic acid molecules with RNA cleaving activity, which specifically cleave RNA encoded by an aryl with cleaving activity, which specifically cleave RNA encoded by an aryl with activity, which specifically cleave RNA encoded by an aryl or an integrin alpha 6 subunit gene, or a Tie-2 gene. AAA16775 to AAA17165 to AAA17651 to AAA17622 represent ribozyme sequences for AAA17635 to AAA19155 to AAA19155 to AAA19155 and AAA18385 and AAA19087 to AAA19154 represent ribozyme sequences for Tie-2, and AAA19087 to AAA19087 and AAA19155 to AAA19222 represent their corresponding target sequences; AAA19223 to AAA21501 to AAA21505 represent ribozyme sequences; AAA21688 represent their corresponding target sequences; AAA21689 represent their corresponding target sequences; AAA21689 to AAA21675 and AAA21635 represent ribozyme sequences; AAA21689 represent their corresponding target sequences; AAA21689 represent their corresponding target sequences; AAA21689 to AAA21675 and AAA21675 to AAA21682 represent their corresponding target sequences; AAA21689 to AAA21675 and AAA22476 to AAA23262, AAA23431 to for integrin subunit beta 3, and AAA22476 to AAA23262, AAA23431 to the invention are used for modulating the sequences. The ribozyme sequence of the invention are used for modulating the sequences the ribozyme of the mana encouraging angiogenic factor, especially ase related capencration (ARM), inflammation, and arthritis, as well as medular degeneration (ARM), inflammation, and arthritis, as well an encouraging the syndrome, Mippel-Trenaunay-Weber syndrome, Osler-Weber-Rendu syndrome, and other syndrome and diseases related to the levels of ARM1, Tie-2, and other syndromes and other syndromes are sequenced to the syndrome of integrin subunit alpha-6, or integrin subunit beta-3.

Novel ribozymes for modulating the synthesis, expression and/or stability of an mRNA encoding an angiogenic factors

Claim 54; Page 237; 305pp; English.

The present invention the pecifically cleare RNA encoded by an aryl hydrocarbon nuclear transporter (ARNT) gene, an integrin submit beta 3 and AAA1761 to AAA1762 represent ribozyme sequences for ARNT, and AAA17651 to AAA1762 and AAA1768 represent their submit their corresponding target sequences; AAA1768 to AAA1768 to AAA1768 to AAA1768 to AAA1768 to AAA1768 to AAA1969 to AAA1915 represent ribozyme sequences for Tie-2, and AAA1838 to AAA1908 to AAA1915 to AAA1915 and AAA1915 represent their corresponding target sequences; AAA1915 to AAA1915 and AAA2180 to The present invention describes enzymatic nucleic acid molecules with integrin subunit alpha-6, or integrin subunit beta-3

integrin subunit alpha-6,

```
The present invention describes enzymatic nucleic acid molecules with RNA cleaving activity, which specifically cleave RNA encoded by an aryl Pydrocarbon nuclear transporter (ARNY) gene, an integrin subunit beta 3 gene, an integrin alpha 6 subunit gene, or a Tie-2 gene. AAA16575 to AAA17167 and AAA1766 to AAA1768 to Fersent their corresponding target sequences; AAA1768 to AAA1885 and AAA19087 to AAA19154 represent ribozyme sequences for Tie-2, and AAA18186 to AAA19087 to AAA19154 represent ribozyme sequences for Tie-2, and AAA18186 to AAA1908 to AAA19155 to AAA19159 to AAA19155 to AAA191595 to AAA19159 to AAA18188 to AAA18189 to AAA2189 to A

The present invention describes enzymatic nucleic acid molecules with RAG cleaving activity, which specifically cleave RNA encoded by an aryl Pydrocarbon nuclear transporter (ARNY) gene, an integrin submit beta 3 gene, an integrin alpha 6 subunit gene, or a Tie-2 gene. AAA16775 to AAA17167 and AAA17561 to AAA1762 represent ribozyme sequences for AAN1767 and AAA1768 to AAA1768 to AAA1768 to AAA1768 to AAA1768 to AAA1985 and AAA19087 to Corresponding target sequences for Tie-2, and AAA19087 to AAA19154 represent ribozyme sequences for Tie-2, and AAA19087 to AAA19155 to AAA19152 represent their corresponding target sequences; AAA19155 to AAA19155 and AAA21850 to AAA21850 and AAA21850 to AAA21850 and AAA21850 to AAA21850 and AAA21850 to AAA21850 and AAA23283 to AAA21850 and AAA23363 to AAA23362 to AAA2333 t

                                                                                                                                                                                      ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       This invention describes a novel isolated nucleic acid (A) for the Neisseria gonorrhoeae GC-3 sequence. The isolated nucleic acid (A) and fragments of (A) are used for the species-specific detection of Neisseria gonorrhoeae in standard amplification or hybridization assays. Fragments of (A) are species-specific with no detectable cross-reaction with any other species, so they provide a rapid, reliable and selective (down to 10 genomic copies) diagnosis, AAZ24068-Z24090 represent PCR primers used in the identification of the N. gonorrhoeae GC3 fragment described in the cethod of the invention.
macular degeneration (ARMD), inflammation, and arthritis, as well as neovascular glaucoma, myopic degeneration, psoriasis, verruca vulgaris, angiofibroma of tuberous scleroals, pot-wine stains, Sturge Weber syndrome, Kippel-Trenaunay-Weber syndrome, Osler-Weber-Rendu syndrome, and other syndromes and diseases related to the levels of ARMT, Tie-2, integrin subunit alpha-6, or integrin subunit beta-3.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Isolated nucleic acid for the GC-3 fragment from Neisseria gonorrhoeae,

The present invention describes fifteen new mutants of the breast cancer susceptibility gene BRCA1 gene, the mutations being located at mutleocides 421-2, 815, 926, 1050, 2034, 4483, 4643, 5053, 5210, 5396.460, 5150, 3904, 3888, 903, and 4164. AAX80255 to AAX80289 represent allele specific oligonucleotides for the mutant and wild type sequences of human BRCA1, and so are capable of identifying the normal or mutant end by hybridisation. Methods from the present invention may be used for detecting a predisposition to cancer, especially breast cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Gaps

```
capable of modulating a process in a biological system. The method capable of modulating a process in a biological system. The method comparises: (a) introducing into the system a random library of mucleic comparises: (a) introducing a substrate binding domain (SBD), comparising a random sequence, and a catalytic domain (CD); and (D) identifying NAC in systems where modulation has occurred and/or determining the sequence of at least part of the SBDs in such systems. Nucleic acid molecules with endomuclease activity and catalytic activity, from the present invention, are used to modulate gene expression in plant and mammalian cells and to cleave target nucleic acid, particularly for treating systemic diseases caused by specific RNA, e.g. cancer, inflammation, psortais, non-leagued and mutations in diseased cells and to determine careful systemic diseases caused by specific RNA, cleaving activity that modulate careful systemic diseases are set in an elle and to treat cancer, restences to periasis or rheumatoid arthritis, or generally any condition associated with the level of c-raf. Introduction of sugar/phosphate modifications in creases stability against nuclease and activity. Avy9922 to Avy93877 represent NACs that can be used in the method, specifically for modulating the expression of a Raf gene.
                                                                                                                                                                                                                                                                processes - especially ribozymes that cleave Raf RNA for treating cancer, restenosis, and also new ribozymes and modified nucleoside triphosphates used as antiviral agents and synthons
                                                                                                                                                                                                                                       Identifying new catalytic nucleic acid that modulates selected
                                                                                                                                                                                                                                                                                                                                                                             Claim 177; Page 147; 259pp; English.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The present invention describes fifteen new mutants of the breast cancer susceptibility gene BRCA1 gene, the mutations being located at nucleotides 421-2, 815, 926, 1506, 2034, 4643, 4643, 5053, 5210, 5396,460, 5150, 3904, 3888, 993, and 4164. AAX80235 to AAX80289 represent allele specific oligonucleotides for the mutant and wild type sequences of human BRCA1, and so are capable of identifying the normal or mutant gene by hybridisation. Methods from the present invention may be used for detecting a predisposition to cancer, especially breast cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Gaps

The present invention relates to enzymatic and antisense nucleic acid molecules that act as inhibitors of the expression of repressor genes encoding the TRS Orphan receptor, EAR3/COUP-TF-1, the GATA transcription factor gene, IRF-2 and/or the CAATT Displacement Protein (CDP). Inhibition of the repressors removes prevents thin bition (and consequently increases expression of) genes involved in the production of eryhmopoletin, granulocyte colony stimulating factor protein and interferon alpha.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The present invention relates to enzymatic and antisense nucleic acid
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Enzymatic and antisense nucleic acid inhibition of repressor genes, useful for producing e.g. granulocyte colony stimulating factor protein, interferon alpha and erythropoietin -
                                                                                                                                                                                                                    Enzymatic and antisense nucleic acid inhibition of repressor genes, useful for producing e.g. granulocyte colony stimulating factor protein, interferon alpha and erythropoietin -

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  AAF0332
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      a
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   8
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   capable of modulating a process in a biological system. The method capable of modulating a process in a biological system. The method comparises: (a) introducing into the system a random library of mucleic comparises: (a) introducing a substrate binding domain (SBD), comparising a random sequence, and a catalytic domain (CD); and (b) identifying NAC in systems where modulation has occurred and/or determining the sequence of at least part of the SBDs in such systems. Nucleic acid molecules with endomuclease activity and catalytic activity, from the present invention, are used to modulate gene expression in plant and mammalian calls and to cleave target mucleic acid, particularly for treating systemic diseases caused by specific RNA, e.g. cancer, inflammation, psortaisis, non-hepatic ascites and infection. They may also be used to pertains in diseased cells and to determine craft RNA. Specifically NACs with RNA-cleaving activity that modulate craft the level of c-raf. Introduction of sugar/phosphate modifications with the level of c-raf. Introduction of sugar/phosphate modifications in the method, specifically for modulating the expression of a Raf gene.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Gaps

ö
molecules that act as inhibitors of the expression of repressor genes encoding the TR2 Orphan receptor, BR3/COUP-TP-1, the GATA transcription factor gene, IRP-2 and/or the CAATT Displacement Protein (CDP). Inhibition of the repressors removes prevents inhibition (and consequently increases expression of) genes involved in the production of erythropoietin, granulocyte colony stimulating factor protein and interferon alpha.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The present invention relates to enzymatic and antisense nucleic acid molecules that act as inhibitors of the expression of repressor genes encoding the TR2 Orphan receptor, EAR3/COUP-TF-1, the GATA transcription factor gene, IRP-2 and/or the GATA Displacement Protein (CDP). Inhibition of the repressors removes prevents inhibition (and consequently increases expression of genes involved in the production of erythropoietin, granulocyte colony stimulating factor
                                                                                                                                                                                                                               Gарв
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Ensymatic and antisense nucleic acid inhibition of repressor genes, useful for producing e.g. granulocyte colony stimulating factor protein, interferon alpha and erythropoietin -

The present invention relates to enzymatic and antisense nucleic acid molecules that act as inhibitors of the expression of repressor genes encoding the TR2 Orphan receptor, RAR3/COUP-TF-1, the GATA transcription factor gene, IRF-2 and/or the CAATT Displacement Protein (CDP). Inhibition of the repressors removes prevents inhibition (and consequently increases expression of) genes involved in the production of erythropoietin, gramulocyte colony stimulating factor protein and interferon alpha.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Gaps

                                                                                                                                                                                                                                         셤
                                                                                                                                                                                                                                                                                                                                                                                                                                                ö
                                                                                                                                                                                                                                                     The present invention relates to enzymatic and antisense nucleic acid molecules that act as inhibitors of the expression of repressor genes encoding the TR2 Orphan receptor, EAR3/COUP-TR-1, the GATA transcription factor gene, IRF-2 and/or the CAATA Displacement Protein (CDP). Inhibition of the repressors removes prevents inhibition (and consequently increases expression of) genes involved in the production of erythropoietin, granulocyte colony stimulating factor protein and interferon alpha.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The present invention relates to enzymatic and antisense nucleic acid molecules that act as inhibitors of the expression of repressor genes encoding the TR2 Orphan receptor, BAR3/COUP-IT-1, the GARA transcription factor gene, IRR-2 and/or the CAATY Displacement Protein (CDP). Inhibition of the repressors removes prevents inhibition (and consequently increases expression of) genes involved in the production of erythropoietin, granulocyte colony stimulating factor protein and interferon alpha.
The present invention relates to enzymatic and antisense nucleic acid molecules that act as inhibitors of the expression of repressor genes encoding the TR2 Orphan receptor, BAR3/COUF-TF-1, the GATA transcription factor gene, IRF-2 and/or the CAATT Displacement Protein (CDP). Inhibition of the repressors removes prevents the production of exphroposietin, granulocyte colony stimulating factor protein and interferon alpha.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Gaps
                                                                                                                                                                                                                                                                                                                                                                        Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Bnzymatic and antisense nucleic acid inhibition of repressor genes,
useful for producing e.g. granulocyte colony stimulating factor
protein, interferon alpha and erythropoietin -

The present invention relates to enzymatic and antisense nucleic acid molecules that act as inhibitors of the expression of repressor genes encoding the TR2 Orphan receptor, EAR3/COUP-TF-1, the GATA transcription factor gene, IRF-2 and/or the CAATT Displacement Protein (CDP). Inhibition of the repressors removes prevents inhibition (and consequently increases expression of) genes involved in the production of erythropoietin, granulocyte colony stimulating factor protein and interferon alpha.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Ensymatic and antisense nucleic acid inhibition of repressor genes, useful for producing e.g. granulocyte colony stimulating factor protein, interferon alpha and erythropoietin -

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The present invention relates to enzymatic and antisense nucleic acid molecules that act as inhibitors of the expression of repressor genes encoding the TR2 Orphan receptor. RAR3/COUP-TR-1, the GATA transcription factor gene, IRR-2 and/or the CAATT Displacement Protein (CDP). Inhibition of the repressors removes prevents inhibition (and consequently increases expression of) genes involved in the production of erythropoietin, granulocyte colony stimulating factor protein and interferon alpha.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ö
                  The present invention relates to enzymatic and antisense nucleic acid molecules that act as inhibitors of the expression of repressor genes encoding the TR2 Orphan receptor, EAR3/COUP-TP-1, the GATA transcription factor gene, IRF-2 and/or the CAAT Displacement Protein (CDP). Inhibition of the repressors removes prevents inhibition (and consequently increases expression of) genes involved in the production of erythropoietin, granulocyte colony stimulating factor protein and interferon alpha.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The present invention relates to enzymatic and antisense nucleic acid molecules that act as inhibitors of the expression of repressor genes encoding the TR2 Orphan receptor, EARJ/COUP-TR-1, the GATA transcription factor gene, IRF-2 and/or the CAATA Displacement Protein (CDP). Inhibition of the repressors removes prevents inhibition (and consequently increases expression of) genes involved in the production of erythropoietin, granulocyte colony stimulating factor protein and interferon alpha.

The present invention relates to enzymatic and antisense nucleic acid molecules that act as inhibitors of the expression of repressor genes encoding the TR2 Orphan receptor, EARJ/COUP-TF-1, the GATA transcription factor gene, IRR-2 and/or the CAAT Displacement Protein (CDP). Inhibition of the repressors removes prevents inhibition (and consequently increases expression of) genes involved in the production of erythropoietin, granulocyte colony stimulating factor protein and interferon alpha.

Ensymatic and antisense nucleic acid inhibition of repressor genes, useful for producing e.g. granulocyte colony stimulating factor protein, interferon alpha and erythropoietin -

with a target sequence and contain at least one phosphoro(di)thicated like, having endomuclease activity. (A), and more generally any catalytic mucleic acid (A') that modulate expression of the oestrogen receptor gene, are used to treat cancer (particularly of breast or cancertion), in vivo or by transforming cells ex vivo and implanting treated cells, or for other conditions associated with levels of constrogen receptor. Because of the high selectivity for targeted RNA, (A) and leo be used to correlate inhibition of gene expression with alterations in phenotype, particularly for identification of therapeutic targets, and as research reagents (for RNA, in the same way that restriction endomucleases are used with DNA). The combination of modifications in (A) improves resistance to mucleases, binding affinity and/or activity. AAA23503 to AAA2474 represent oestrogen receptor hairbin ribozyme sequences, and AAA2509 to AAA2502 represent corresponding target sequences, and AAA2519 to AAA2521 represent their corresponding target sequences. AAAA3509 to AAA2521 represent cherribozyme sequences. AAAA3529 to AAA2521 represent cherribozyme sequences. AAAA3529 to AAA2521 represent cherribozyme sequences. AAAA3529 to AAA2521 represent cherribozyme sequences. AAA35219 to AAA2521 represent cherribozyme sequences and antisense oligonucleotides used in the chempton.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Oestrogen receptor hammerhead ribozyme target sequence SEQ ID NO:1861
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Oestrogen receptor; c-raf; k-ras; bcl-2; ribozyme; cleavage; hammerhead inbozyme; balrpin ribozyme; antiense oligomucleotide; gene expression modification; cancer; phosphorothioate; endonuclease; anticancer; breast cancer; endometrium cancer; sa

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ..
                                                                                                                                                                                                                                                                                                                                                        The present invention relates to a hairpin or hammerhead ribozyme, designed to cleave RNA encoding a cyclin or cell-cycle dependent kinase other than cell-cycle dependent kinases CDK1. PCNA and Cyclin B1. Representative examples of ribozyme recognition sites are given in AAAB315 to AAAB6787. The ribozyme of the invention is useful for inhibiting restenosis by introduction of the ribozyme is resistant to endomuclease activity and hence is efficient in restenosis treatment.
                                                                                                                                                                                                                                               New hairpin and hammerhead ribozyme for inhibiting restenosis, cleaves RNA encoding a cyclin or cell-cycle dependent kinase other than CDKI, PCNA and Cyclin B1

The present invention describes nucleic acids (A) that interact stably with a target sequence and contain at least one phosphoro(di) thioate link, having endonuclease activity. (A), and more generally any catalytic nucleic acid (A') that modulates expression of the oestrogen receptor gene, are used to treat cancer (particularly of breast or endometrium), in vivo or by transforming cells ex vivo and implanting treated cells, or for other conditions associated with levels of controllate inhibition of gene expression with alterations in phenotype, particularly for identification of therapeutic targets, and as research reagents (for RNA, in the same way that restriction endomucleases are used with DNA). The combination of modifications in (A) improves resistance to nucleases, binding affinity and/for activity. Analysisois to AAAA47478 to AAA2592 represent their corresponding target sequences. AAA2593 to AAAA5619 to AAAA5217 represent costrogen receptor harmmenhead ribozyme sequences. AAA2593 to AAAA5619 to AAAA56218 represent their corresponding target sequences. AAA26219 to AAAA5621 represent their corresponding target sequences. AAA26219 to AAAA5621 represent their corresponding target sequences. AAA26219 to AAAA5621 represent their corresponding target sequences. AAA26219 to AAAA6211 represent their corresponding target sequences and anisense oligonucleotides used in the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Oestrogen receptor hammerhead ribozyme target sequence SEQ ID NO:1863
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Oestrogen receptor; c-raf; k-ras; bcl-2; ribozyme; cleavage; hammerhead ribozyme; hairpin ribozyme; antisense oligonuclectide; gene expression modification; cancer; phosphorothioate; endonuclease; anticancer; breast cancer; endometrium cancer; ss.

The present invention describes nucleic acids (A) that interact stably with a target sequence and contain at least one phosphoro(di)thloate (Ink, having endomuclases extravity. (A), and more generally any catalytic nucleic acid (A) that modulates expression of the oestrogen catalytic nucleic acid (A) that modulates expression of the oestrogen receptor gene, are used to treat cancer (particularly of breast or conformatium), in vivo or by transforming cells ex vivo and implanting treated cells, or for other conditions associated with levels of cataled cells, or for other conditions associated with levels of cataled cells, or for other conformation of the high selectivity for targeted RNA, (A) contrained to correlate inhibition of gene expression with categors, and as research reagents (for RNA, in the same way that confiction endomucleases are used with DNA). The combination of therapeutic modifications in (A) improves resistance to nucleases, binding affinity and/or activity. AAA23503 to AAA2393 to AAA2392 represent their corresponding target sequences, and AAA2393 to AAA2392 represent their corresponding target sequences, and AAA2393 to AAA2593 to AAA2593 represent ceptor receptor hairpin ribozyme sequences, and AAA2393 to AAA2593 represent ceptor receptor hairpin ribozyme sequences. AAA25619 to AAA2591 represent coher ribozyme sequences. AAA256219 to AAA2591 represent coher ribozyme sequences and antisense oligonucleotides used in the construction.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Oestrogen receptor hammerhead ribozyme target sequence SEQ ID NO:1864
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Gaps

The present invention describes nucleic acids (A) that interact stably with a target sequence and contain at least one phosphoro(di)thioate link, having endonuclease activity. (A), and more generally any catalytic nucleic acid (A') that modulates expression of the cestrogen receptor gene, are used to treat cancer (particularly of breast or reated cells, or for other conditions associated with levels of cestrogen receptor Because of the high selectivity for targeted RNA, (A) and also be used to correlate inhibition of gene expression with alterations in phenotype, particularly for identification of therapeutic targets, and as research reagens (for RNA, in the same way that cestriction endonucleases are used with DNA). The combination of modifications in (A) improves resistance to nucleases, binding affinity and/or activity, AAA23503 to AAA24747 represent cestrogen receptor corresponding target sequences, and AAA2503 to AAA2503 represent their corresponding target sequences. AAA2603 to AAA2503 represent cettor their corresponding target sequences. AAAA2603 to AAA2613 represent other ribozyme sequences. AAAA2619 to AAA2613 represent other ribozyme sequences and antisense oligonucleotides used in the exemplification of the present invention. \$88888888888888888888888888

can also be used to correlate inhibition of gene expression with alterations in phenotype, particularly for identification of therapeutic targets, and as research reagents (for RNA, in the same way that restriction endonucleases are used with DNA). The combination of modifications in (A) improves resistance to nucleases, binding affinity handly AAA23503 to AAA2474 represent osetrogen receptor hammerhead riboxyme sequences, and AAA2474 to AAA2592 represent their corresponding target sequences, and AAA2593 to AAA2592 represent their receptor halrpin riboxyme sequences, and AAA26107 to AAA26108 represent their corresponding target sequences, and AAA26107 to AAA26118 represent their corresponding target sequences. AAA26219 to AAA26211 represent other riboxyme sequences and antisense oligonucleotides used in the exemplification of the present invention.

Oligonucleotide for targeted alterations of genetic sequences and for treating cystic fibrosis, comprises at least one mismatch and chemical modification -

Claim 7; Page 90; 294pp; English.

The present invention provides single-stranded oligomucleotides which can be used for the targeted alteration of genomic sequences, where the oligomucleotide has at least one mismatch compared with the genomic

The present invention provides single-stranded oligonucleotides which can be used for the targeted alteration of genomic sequences, where the

```
ö
sequence to be altered. In particular, these sequences are directed at the following genes: adenosine deaminase, p53, beta-globin, retinoblastoma, BRCAJ, BRCAZ, CTRR, cyclin-dependent kinase inhibitor 2A (CDKNZA), APC, Factor V, Factor VII, Factor IX, hemoglobin alpha locus I (HBAI), hemoglobin alpha locus 2 (HBAZ), MHI, MSH2, MSH6, MSH6, apolipoprotein E (ADOS), LDL receptor (LDIRA), UDP-Glucuronosyl transferase (UGT1), amyloid precursor protein (APC), presentlin-1 (PSENI) and presentlin-2 (PSENI). These can be used in the gene therapy of diseases such as cancer, adenosine deaminase deficiency, cystic fibrosis, haemophilia, hypercholesterolaemia, thalassaemia, sickle cell anaemia, halbelmer, s disease, malanoma, adenomatous polyposis of the colon and various syndromes. The present sequence is one of the gene correcting oligonucleotides of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Human; gene therapy; adenosine deaminase deficiency; p53; beta-globin; retinoblastoma; BRCA1; BRCA2; CFTR; cystic fibrosis; cancer; Factor V; cyclin-dependent kinase inhibitor 2A; CDKN24; melanoma; APC; HEA21; HEA21; adenomatous polyposis of the colon; Factor VII; Factor IX; thrombosis; haemophilia; alpha thalassaemia; haemoglobin alpha locus 1; MLH1; APOB; mismacth repair; MSH2; MSH6; hyperlipidaemia; apolipoprotein B; LDLR; familial hyperchelesterolaemia; UGT1; syndrome; APP; FSRN1; antisense; UDP-glucuronosyltransferase; amyloid precursor protein; presentilin-1; Albeiner; g disease; cytostatic; antisickling; antianaemic; haemostatic;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Oligonucleotide for targeted alterations of genetic sequences and for treating cystic fibrosis, comprises at least one mismatch and chemical modification -

oligonucleotide has at least one mismatch compared with the genomic sequence to be altered. In particular, these sequences are directed at the following genes: adenosine deaminase, p53, beta-globin.

retinoblastoma, BRCA1, BRCA2, CFTR, cyclin-dependent kinase inhibitor 2A (DKN2A), APC, Factor V, Factor VII, Factor IX, haemoglobin alpha locus (HML1, MSH2, MSH6, HRM6, APC), Pactor V, Factor VIII, Factor IX, haemoglobin alpha locus apolipoprotein B (APOB), LDL receptor (LDLR), UDP-glucuronosyltransferase (UGT1), amyloid precursor protein (APC), presenilin-1 (PSENI) and presenilin-2 (PSENI) and in the gene therrapy of diseases such as cancer, adenosine deaminase deficiency, cystic fibrosis, haemophilia, hypercholesterolaemia, thalassaemia, sickle cell anaemia, Alzheimer, disease, melanoma, adenomatous polyposis of the colon and various syndromes. The present sequence is one of the gene correcting oligonucleotides of the invention.

Oligonucleotide for targeted alterations of genetic sequences treating cystic fibrosis, comprises at least one mismatch and modification -

Rice MC.

Gamper HB,

Kmiec EB,

WPI; 2001-639230/73.

Claim 7; Page 133; 294pp; English.

The present invention provides single-stranded oligonucleotides which can

```
be used for the targeted alteration of genomic sequences, where the oligomucleotide has at least one mismatch compared with the genomic sequence to be altered. In particular, these sequences are directed at the following genes: adenosine deaminase, p53, beta-globin, thanks constant the following genes: adenosine deaminase, p53, beta-globin, crimoblastoma, BRCA1, BRCA2, CFTR, cyclin-dependent kinase inhibitor 2h (CDRTA3, APC, Factor VIII, Pactor IX, haemoglobin alpha locus (CDRTA3), hEH1, MSH6, MSH6, apolipoprotein E (APOB), LDL receptor (LDLR), UDP-glucuronosyltransferase (UGTI), amyloid preutursor protein (APC), presentlin-1 (PSENI) and presentlin-2 (PSEN2). These can be used in the gene therapy of diseases such as cancer, adenosine deaminase deficiency, cystic fibrosis, haemophilia, hypercholesterolaemia, thalassaemia, sickle cell anaemia, hampening disease, melanoma, adenomatous polyposis of the colon and various syndromes. The present sequence is one of the gene correcting oligomucleotides of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                              ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Human; gene therapy; adenosine deaminase deficiency; p53; beta-globin; retinoblastoma; BRCA1; BRCA2; CFTR; cystic fibrosis; cancer; Factor V; cyclin-dependent kinase inhibitor 2A; CDNV2A; melanoma; APC; HBA1; HBA2; adenomatous polyposis of the colon; Factor VII; Factor IX; thrombosis; haemophilia; alpha thalassaemia; haemoglobin alpha locus 1; MLH1; APOE; mismatch repair; MSH2; MSH6; hyperlipideamia; apolipoprotein B; LDUE; familial hypercholesterolaemia; UGT1; syndrome; APP; PSRN1; antisense; UDP-glucuromosyltransferase; amyloid precursor protein; presentin-1; Alzheimer; disease; cytostatic; antisickling; antianaemic; haemostatic;

```
The present invention provides single-stranded oligonuclectides which can be used for the targeted alteration of genomic sequences, where the CC oligonuclectide has at least one mismatch compared with the genomic sequence to be altered. In particular, these sequences are directed at the following genes: adenosine deaminase, p53, beta-globin.

CC ECKNZA), APC, Pactor V, Pactor VII, Pactor IX, haemoglobin alpha locus (CDKNZA), APC, Pactor VII, Pactor IX, haemoglobin alpha locus (HDRA1), haemoglobin alpha locus (HOTI), amyloid precursor protein (APC), presentilar-I (PSRN) and precursor protein (APC), presentilar-I (PSRN) and precursor protein (APC), presentilar-I (PSRN) and precursor protein (APC), presentilar-I (PSRN). These can be used in the gene therapy of diseases such as cancer, adenosine deaminase deficiency, cystic fibrosis, hemophilia, hypercholesterolaemia, thalassaemia, sickle cell anaemia, Alzheimer's disease, The present sequence is one of the gene correcting oligonuclectides of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ö

The present invention describes a method for treating a proliferative skin or eye disease and scarring. The method involves administering a ribozyme [1] which cleaves RNA encoding a cytokine involved in inflammation, matrix metalloproteinase (WMP), cyclin, cell-cycle dependent kinase, growth factor or a reductase, or administering a nucleic acid molecule [11] comprising a promoter operably linked to a nucleic acid segment encoding [1]. [1] can have antipsoriatic, cytostatic, antiseborrheic, antidiabetic, antisickling, dermatological, cytostatic, antiseborrheic, antidiabetic, antisickling, cytostathoric in the antidiabetic, antisickling, dermatological, cytostatic, antiseborrheic, antidiabetic, antisickling, cleaves RNA encoding Gytokine involved in inflammation. [1] can be used in gene therapy. [1] and [11] are useful for treating proliferative keratosis, skin diseases such as psoriasis, atopic dermatities, actinic keratosis, also be used for treating proliferative eye diseases such as diabetic also be used for treating proliferative eye diseases such as diabetic retinopathy, vitreoretinopathy, sickle cell retinopathy, retinopathy of prematurity and retinal detachment, and for treating and preventing scarring such as keloid, adhesion and hypertrophic or hypertrophic burn eventification of the companial event in the companial contraction and injection or hypertrophic burn event in the companial contraction and contracting and preventing and contraction and contracting and preventing event in the contraction and contracting an
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The present sequence is given in a specification relating to a method for identifying inhibitors of SarA (staphylococcal accessory regulator) function involved in the expression of Staphylococcal virulence genes. The method comprises contacting a candidate inhibitor with a SarA binding site of the agr (accessory gene regulator) locus in solution
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Identifying inhibitors of staphylococcal SarA (accessory regulator) which are useful for treating staphylococcal infections, comprises using specific binding sites of SarA protein on an accessory gene regulator locus

```
The invention relates to a nucleic acid molecule which down regulates expression of a CD20 gene and a nucleic acid molecule which down regulates expression of a neurite growth inhibitor gene (NOGO). The nucleic acids (a.g. a ribozyme or a DNazyme) an Inozyme (an endolytic nucleic acids (a.g. a ribozyme or a possessing an NCH motif), a G-cleaver (cleaving RNA with a NYN

motif) pr an amberzyme (cleaving RNA with an NGN triplet), a zinzyme (cleaving RNA with a VGY motif). The CD20-tergetting nucleic acid is used to cleaving RNA with a VGY motif). The CD20-tergetting nucleic acid is used to cleave RNA of CD20 in the presence of a divalent cation that is preferably Mg^2t. Furthermore, it may be contacted with a cell to reduce associated with the level of CD20. The treatment may further comprise the use of one or more therapies. In particular, the CD20 targetting nucleic acid may be used to treat lymphoma, leaveamia, B-cell , lymphoma, low-grade or follicular NHL, lymphocytic leukaemia, B-cell, bulky low-grade or follicular NHL, lymphocytic leukaemia, HIV (human (NHC), immunodeficiency virus) associated NHL, mantle-cell lymphoma (NHC), immunodeficiency virus) associated NHL, mantle-cell lymphoma (NHC), immunocytopaemia, and inflammatory arthropathy. The NOGO-targetting thrombocytopaemia, and inflammatory arthropathy. The NOGO-targetting divalent cation that is preferably Mg^2t. Furthermore, the nucleic acid may be contacted with a cell to reduce NOGO activity of the cell and creatment may further comprise the use of one or more therapies.

CT treat a patient having a condition associated with the level of NOGO. The treatment may further comprise the use of one or more therapies.

CT treat a patient disease, injury and cerebrovascular accident (CVA, certoxe), Alzheimer's disease, dementia, multiple sclerosis (MS), central nervous system (CNS) injury and cerebrovascular accident (CVA, certoxe), Alzheimer's disease, dementia, multiple sclerosis (MS), checotherapy-induced neuropathy, amd/or other neurodegenerative disease contrast contrast of the modulation of NOGO expression. The states and subject the neuropathy and or other neurodegenerative disease
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ò

Nucleic acid molecules, e.g., enzymatic nucleic acids and antisense constructs, which down regulate expression of a CD20 gene or neurite growth inhibitor gene useful for treating, e.g., lymphoma, leukemia, and central nervous system injury

Claim 88; Page 87; 200pp; English.

The invention relates to a nucleic acid molecule which down regulates expression of a CD20 gene and a nucleic acid molecule which down regulates expression of a neurite growth inhibitor gene (NDCO).

The nucleic acids may be enzymatic nucleic acids (e.g. a ribozyme or a DNAzyme) an Inozyme (an endolytic nucleic acids (e.g. a ribozyme or a DNAzyme) an Inozyme (an endolytic nucleic acids (leaving RNA with a NNA)

CC DNAzyme) an Inozyme (cleaving RNA with an NGN triplet), a zinzyme (cleaving RNA with a NGN treat a patient having a condition to associated with the level of CD20 in the presence of a divalent cation that is used to CD20 treat lymphoma, itelakamia, B-call lymphoma, low-grade or follicular NHL, lymphocytic leukaemia, HTV (human lymphoma, low-grade or follicular NHL, lymphocytic lymphoma (NHL), immunocytoma (INC), small B-call lymphocytic lymphoma (NHL), immunocytoma (INC), small B-call lymphocytic lymphoma (NHL), immunocytoma (INC), small B-call lymphocytic lymphoma, immunocytoma (INC), small B-call lymphocytic lymphoma, immunocytoma (INC), small B-call with the level of NGO gene in the presence of divalent cation that is preferably Mg²+. Furthermore, the nucleic acid may be used to treat central nervous system (CNS) injury and certivity of the cent accident (CNA, creat a patient having a condition associated with the level of NGO, genet treat ment may further comprise the use of one or more therapies. (INC) central nervous system (CNS) injury and certivity of the condition of streas, musuclay, and/or other neurodegeneration (CNA), chemotherapy-induced neuropathy, and/or other neurodegenerative (CNA), chemotherapy-induced is an inozyme of the inve

                                                                                                                                                                                                                                                                                                                                                                                                              Š
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The invention relates to a nucleic acid molecule which down regulates expression of a CD20 gene and a nucleic acid molecule which down regulates expression of a neurite growth inhibitor gene (NDGA). The nucleic acids (e.g. a ribozyme or a DNAzyme) an Inozyme dan endolytic nucleic acids (e.g. a ribozyme or a DNAzyme) an Inozyme (an endolytic nucleic acid cleaving an RNA molecule possessing an NCH motif), a G-cleaver (cleaving RNA with a NYR with a NYR motif) an amberzyme (cleaving RNA with an NGR riplet), a zinzyme (cleaving RNA with an NGR riplet), a zinzyme (cleaving RNA with an NGR riplet), a zinzyme cleaving RNA with a PGF motif). The CD20-targetting nucleic acid is used to cleave RNA of CD20 in the presence of a divalent cation that is preferably Mg^2+. Furthermore, it may be contacted with a cell to reduce

CC CD20 activity of the cell and treat a patient having a condition associated with the level of CD20. The treatment may further comprise the use of one or more therapies. In particular, the CD20 targetting conclude acid may be used to treat lymphoca, leukaemia, B-cell CT2 lymphoma, low-grade or follicular non-Hodgkin's lymphoma (NHL), bulky lymphoma, low-grade or follicular NHL, mantle-cell lymphoma (NHL), bulky conversed or follicular NHL, mantle-cell lymphoma (NHL), includeficiency virus) associated NHL, mantle-cell lymphoma (MCL), immunocytoma (IMC), small B-cell lymphocytic lymphoma, immune (MCL), immunocytomania, and inflammatory arthropathy. The NGO-targetting concluded acid is used to cleave RNA of the NGCO gene in the presence of divalent cation that is preferably Mg^2+. Furthermore, the nucleic acid creat a patient having a condition associated with the level of NGCO. The creat may further comprise the use of one or more therapies. CC treatment may further comprise the use of one or more therapies. CC treatment may further comprise the use of one or more therapies. CC chemctherapy-induced neuropathy, amyotrophic lateral sclerosis (MS), chemctical micromassis (AS), chemctherapy-induced neuropathy, amyotrophic lateral sclerosis (MS). Parkinson's disease, muscular dystrophy, and/or other neurodegenerative disease content of NGCO extract neurodegenerative disease.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         ö

The invention relates to a nucleic acid molecule which down regulates expression of a CD20 gene and a nucleic acid molecule which down regulates expression of a neurite growth inhibitor gene (NGCO).

Togulates expression of a neurite growth inhibitor gene (NGCO).

The nucleic acids may be enzymatic nucleic acids (e.g. a ribozyme or a DNAzwee) an Inozyme (an endolytic nucleic acid cleaving RNA with a NYR MORT motif), a G-cleaver (cleaving RNA with a NYR triplet), a zinzyme (cleaving RNA with a NGH notif), a G-cleaver (cleaving RNA with a NGH notif), a cleaving RNA with a NGH motif). The CD20-targetting nucleic acid is used (cleaving RNA with a YGY notif). The presence of a divident cation that is preferably MG'2'+. Furthermore, it may be contacted with a cell to reduce CD2 activity of the cell and treat a patient having a condition associated with the level of CD20. The treatment may further comprise the use of one or more therapies. In particular, the CD20 targetting cucleic acid may be used to treat lymphoma, low-grade or follicular NHL, lymphocytic leukaemia, HIV (human immunocytoma (IMC), small b-cell lymphocytic lymphoma, immunocytoma (IMC), sm
                                                                                                                                                           Nucleic acid molecules, e.g., enzymatic nucleic acids and antisense constructs, which down regulate expression of a CD20 gene or neurite growth inhibitor gene useful for treating, e.g., lymphoma, leukemia,

03-JAN-2003 (first entry)

Human HTPL scanning oligonucleotide SEQ ID 1929.

Human; gene therapy; tumour suppressor; HTPL; chromosome 10p12.1; human testis expressed Patched like protein; testis; adrenal; liver; male germ cell development; bone marrow; brain; kidney; lung; placenta; prostate; skeletal muscle; colon; male infertility; cancer; ss.

```
The present invention relates to human testis expressed Patched like protein (HTPL, see ABV78759 to ABV78762 and ABB98519 to ABB98520). HTPL has two isoforms, with a few single base pair differences between the two. One of the single base pair changes introduces a premature stop two. One of the single base pair changes introduces a premature stop codon in HTPL-S (S for short) compared to HTPL-L (L for long). HTPL chartes an overall structure organization with the Patched protein. The shares an overall structure organization with the Patched protein. The shares at overtural features strongly imply that HTPL plays a role similar to that of Patched, and is a potential tumour suppressor. HTPL is important in regulating male germ cell development, and the HTPL gene was important in regulating male germ cell development, and the HTPL gene was uspect to human chromosome lppi2.1. HTPL and its coding sequence are useful for diagnosing a disorder sused by mutation in HTPL, and in therapy and manufacture of a medicament for treatment or prevention of therapy and manufacture of a medicament for treatment or prevention of therapy and manufacture disorders of testis, or adrenal, adult and foctal liver, bone marrow, brain, kidney, lung, placenta, prostate, skeletal muscle or colon function. HTPL proteins and mucleic acids are clinically useful dispancetic markers and potenial therapeutic agents for walmple from the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Novel isolated human testis expressed Patched like protein (HTPL), useful for identifying agonist and antagonist and specific binding partners, and for treating subjects having defects in HTPL -
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                1.0%; Score 12.8; DB 1; Length 17; 87.5%; Pred. RESULT 553 ABV80685/ Human HTPL scanning oligonucleotide SEQ ID 1931.

Human; gene therapy; tumour suppressor; HTPL; chromosome 10p12.1; human testis expressed Patched like protein; testis; adrenal; liver; male germ cell development; bone marrow; brain; kidney; lung; placenta; prostate; skeletal muscle; colon; male infertility; cancer; ss.

Homo sapiens

```
The present invention relates to human testis expressed Patched like protein (HTPL, see ABV78759 to ABV78762 and ABB98519 to ABB98520). HTPL has two isoforms, with a few single base pair differences between the cwo. One of the single base pair changes introduces a premature stop codon in HTPL-S (single base pair changes introduces a premature stop codon in HTPL-S (single base pair changes introduces a premature stop codon in HTPL-S (single base) and the HTPL base pair changes an overall structure organisation with the Patched protein. The shared structural features strongly imply that HTPL plays a role similar to that of Patched, and is a potential tumour suppressor. HTPL is important in regulating male germ cell development, and the HTPL gene was maportant in regulating and gram cell development, and the Gram are useful for diagnosing a disorder caused by mutation in HTPL, and in there, such disorder associated with decreased expression or activity of human HTPL. Such disorders include disorders of testis, or adrenal, adult and feetal muscle or colon function. HTPL proteins and mucleic acids are clinically useful diagnostic markers and potential therapeutic agents for male infertility and cancer. The present oligonucleotide was used in an example from the invention.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      d
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The present invention relates to human testis expressed Patched like protein (HTPL, see ABV78759 to ABV89851 to ABS98510; HTPL has two isoforms, with a few single base pair differences between the two. One of the single base pair changes introduces a premature stop codon in HTPL-1. (I for long). HTPL changes an overall structure organisation with the Patched protein. The shares an overall structure organisation with the Patched protein. The shared structural features strongly imply that HTPL plays a role similar to that of Patched, and is a potential tumour suppressor. HTPL sen important in regulating male aprendly imply that HTPL plays a role similar mapped to human chromosome 10pl2.1. HTPL and its coding sequence are mapped to human chromosome 10pl2.1. HTPL and its coding sequence are useful for diagnosing a disorder caused by mutation in HTPL, and in the such disorder associated with decreased expression or activity of human for the sorder included disorders of testis, or adrenal, adult and foetal liver, bone marrow, brain, kidney, lung, placenta, prostate, skeletal muscle or colon function. HTPL proteins and nucleic acids are clinically useful diagnostic markers and potenial therapeutic agents for male infertility and cancer. The present oligonucleotide was used in an example from the invention.

The present invention relates to human testis expressed Patched like protein (HTPL, see ABV78759 to ABV78762 and ABB98519 to ABB98520). HTPL has two isoforms, with a few single base pair differences between the two of the single base pair changes introduces a premature stop codon in HTPL-S (S for short) compared to HTPL-L (L for long). HTPL shares an overall structure organisation with the Patched protein. The shares an overall structure strongly imply that HTPL plays a role similar to that of Patched, and is a potential tumour suppressor. HTPL so similar important in regulating male germ cell development, and the HTPL gene was mapped to human chromosome 10pl2.1. HTPL and its coding sequence are useful for diagnosing a disorder caused by mutation in HTPL, and in the such disorder associated with decreased expression or activity of human HTPL. Such disorders include disorders of testis, or adrenal, adult and such disorders include disorders of testis, or adrenal, adult and close the infertility and cancer. The present oligonucleotide was used in an example the infertility and cancer. The present oligonucleotide was used in an example the infertility and cancer. The present oligonucleotide was used in an example the properties.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Sequence 17 BP; 5 A; 3 C; 1 G; 8 T; 0 other;

The invention relates to an isolated SH3 domain (POSH)-like signalling protein 1 (POSHL 1) polypeptide (I), comprising a sequence of 730 amino acids (SI, ABBB3999), a sequence having 6% sequence identity to (SI), (SI), having 95% deviations, especially conservative substitutions or a fragment of the sequences comprising at least 8 contiguous amino acids. Human POSHL 1 is a prote-oncogene/oncogene product that functions as an adaptor protein that interacts with Rho family small GTBases as well as downstream components of the signal transduction pathway. (I) is useful for interaction of the signal transduction pathway. (I) is useful correcting (I) are useful for diagnosing, monitoring disease and tracting treating cancer, they useful in the development of vaccines and (II) is useful in gene therapy. (II) is useful for constructing microarrays which transgenic non-human animals capable of producing the procession and creating transgenic non-human animals capable of producing the process. The
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            å

              ABK56195
                                      The invention relates to an isolated SH3 domain (POSH)-like signalling protein 1 (POSH 1) polypeptide (1), comprising a sequence of 730 amino acids (S1, ABB3399), a sequence having 65% sequence of 730 amino acids (S1) having 95% deviations, especially conservative substitutions or a fragment of the sequences comprising at least 8 contiguous amino acids. Human POSHL 1 is a proto-oncogene/oncogene product that functions as an adaptor procein that interacts with Rho family small GTPsess as well as adaptor procein that interacts with Rho family small GTPsess as well as components of the signal transduction pathway. (I) is useful for identifying a specific binding partner. (I) and nucleic acids (II) encoding (I) are useful for diagnosing, monitoring disease and treating cancer, they useful in the development of vaccines and (II) is useful in gene therapy. (II) is useful for constructing microarrays which transgenic non-human animals capable of producing the proteins. The present sequence is that of a scanning oligonucleotide useful in examples
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                of the invention.

Note: The present sequence did not form part of the printed
specification, but is based on sequence information supplied to Derwent
by the Buropean Patent Office.
                                                                             nn, POSHL 1; SH3 domain; POSH-like signalling protein 1; oncogene; GTPase; signal transduction; gene expression; cancer; vaccine;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Novel human SH3 domain (POSH)-like signalling protein 1 polypeptide, POSHL-1, useful for treating disorders associated with decreased expression or activity of human POSHL1 -
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        / Match 1.0%; Score 12.8; DB 1; Length 17; Local Similarity 87.5%; Pred. ```
The invention relates to enzymatic nucleic acid molecules that down regulate expression of chloride channel calcium activated 1 (CLCA1) genes by cleaving RNA derived from the genes. The mucleic acid sequences are useful as pharmaceutical agents for treating conditions such as chronic obstructive pulmonary disease (CPD), chronic bronchitis, asthma, cystic fibrosis, obstructive bowel syndrome and any other diseases or conditions that are related to or will respond to the levels of CLCA1 in a cell or tissue. The sequences are useful for reducing CLCA1 activity in a cell, thence, are useful for treatment of a patient having a condition associated with the level of CLCA1, where the invention further comprises the use of one or more therapies under conditions suitable for the treatment, for example, oxygen therapy, bronchodilators, corticosteroids, antibacterials, vaccinations, acetylcysteine and mucokinetic agents. The mucleic acids of the invention are also used as diagnostic tools to examine genetic drift and mutations within diseased cells or to detect the presence of CLCA1, where the invention are also used as diagnostic tools to the presence of CLCA1 in a cell. This sequence represents an
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ö

The invention relates to enzymatic nucleic acid molecules that down regulate expression of chloride channel calcium activated 1 (CLCA1) genes by cleaving RNA derived from the genes. The nucleic acid sequences are useful as pharmaccutical agents for treating conditions such as chronic obstructive pulmonary disease (COPD), chronic bronchitis, asthma, cystic librosis, obstructive bowel syndrome and any other diseases or conditions that are related to or will respond to the levels of CLCA1 in a cell or tissue. The sequences are useful for reducing CLCA1 activity in a cell, hence, are useful for treatment of a patient having a condition associated with the level of CLCA1, where the invention further comprises the use of one or more therapies under conditions suitable for the treatment, for example, oxygen therapy, bronchodilators, corritosereoids, antibacterials, vaccinations, acetyloysteine and mucokinetic agents. The nucleic acids of the invention are also used as diagnostic tools to examine genetic drift and mutations within diseased cells or to detect the presence of CLCA1 RNA in a cell. This sequence represents an expressents and expressents and example or the presence of CLCA1 RNA in a cell. This sequence represents and expressions and example of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Length 17;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Sequence 17 BP; 8 A; 4 C; 2 G; 3 U; 0 other;

The invention relates to enzymatic mucleic acid molecules that down regulate expression of chloride channel calcium activated 1 (CLCA1) genes by clearing RNA derived from the genes. The mucleic acid sequences are useful as pharmaceutical agents for treating conditions such as chronic obstructive pulmonary disease (COPD), chronic bronchitis, asthma, cystic cibrosis, obstructive bowel syndrome and any other diseases or conditions that are related to or will respond to the levels of CLCA1 in a cell or tissue. The sequences are useful for reducing CLCA1 activity in a cell, hence, are useful for treatment of a patient having a condition associated with the level of CLCA1, where the invention further comprises the use of one or more therapies under conditions suitable for the treatment, for example, oxygen therapy, bronchodilators, corticosteroids, antibacterials, vaccinations, acetylcysteine and mucokinetic agents. The nucleic acids of the invention are also used as diagnostic tools to can amine genetic drift and mutations within diseased cells or to detect the presence of CLCA1 kNA in a cell. This sequence represents an

The invention relates to enzymatic nucleic acid molecules that down regulate expression of chloride channel calcium activated I (CLCA1) genes by cleaving NAM derived from the genes. The nucleic acid sequences are useful as pharmaceutical agents for treating conditions such as chronic obstructive pulmonary disease (CDPD), chronic bronchitis, asthma, cystic fibrosis, obstructive bowel syndrome and any other diseases or conditions that are related to or will respond to the levels of CLCA1 in a cell, there, are useful for treatment of a patient having a condition cassociated with the level of CLCA1, where the invention further comprises the use of one or more therapies under conditions suitable for the creatment, for example, oxygen therapy, bronchodilators, corticosteroids, antibacterials, vaccinations, acetyloysteine and mucokinetic agents. The nucleic acids of the invention are also used as diagnostic tools to examine genetic drift and mutations within diseased cells or to detect the presence of CLCA1 RNA in a cell. This sequence represents an

Human CLCAl gene enzymatic nucleic acid #1429.

```
The invention relates to enzymatic nucleic acid molecules that down capulate expression of chloride channel calcium activated 1 (CLCA1) genes by cleaving RNA derived from the genes. The nucleic acid sequences are useful as pharmaceutical agents for treating conditions such as chronic obstructive pulmonary disease (COPD), chronic bronchitis, asthma, cystic through obversity bewell syndrome and any other diseases or conditions that are related to or will respond to the levels of CLCA1 in a cell or tissue. The sequences are useful for reducing CLCA1 activity in a cell, connected with the level of CLCA1, where the invention further comprises the use of one or more therapies under conditions suitable for the cample, oxygen therapy, bronchodilators, corticosteroids, antibacterials, vaccinations, acetylycyteine and mucokinetic agents. The nucleic acids of the invention are also used as diagnostic tools to examine genetic drift and mutations within diseased cells or to detect the presence of CLCA1 RNA in a cell. This sequence represents an expressing an expression or expressions.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ö
                                                                                                                                                                                                                                                                                                                                                                                                                       Enzymatic polymucleotide that down regulates expression of chloride channel calcium activated gene, useful for treating Chronic obstructive pulmonary disease (COPD), chronic bronchitis and asthma
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Human; hammerhead ribozyme; cytostatic; antitumour; antidiabetic; ophthalmological; antiarthritic; antipsoriatic; virucide; osteopathic; vulnerary; cancer; lymphoma; Bwing's sarcoma; melanoma; psoriasis; tucour angiogenesis; diabetic retinopathy; macular degeneration; neovascular glaucoma; myopic degeneration; arthritis; verruca vulgaris;

```
The invention relates to a nucleic acid molecule (I) which down regulates expression of an Ets-related gene (ERG). (I) is useful for treating conditions selected from cancer, lymphoma, Faury's saarcoma, melanoma, tumour angiogenesis, diabetic retinopathy, macular degeneration, the conditions allowed of tuberous sclerosis, port-wine stains, Sturge velgaris, angiotibroma of tuberous sclerosis, port-wine stains, Sturge Weber syndrome, Rippel-Trenaunay-Weber syndrome, Osler-Weber-rendu syndrome, leukaemia, osteoporosis and wound healing. (I) is useful for treating a patient having a condition associated with the level of ERG, by contacting cells of the patient with (I) under conditions suitable for the treatment. The method comprises the use of one or more therapies or under conditions suitable for the treatment. Leukaemia or tumour conjunction with one or more of other therapies such as radiation or conjunction with one or more of other therapies such as radiation or conjunction with one or more of other therapies such as radiation or computence is treated by administering (I) to the patient in a cell, by contacting the cell with (I). (I) is useful for cleaving RNA of ERG gene, by contacting the cell with (I). (I) is useful for cleaving RNA of cation such as Mg2+. (I) is useful for reducing edigence to the expression of ERG, and as diagnostic tool to examine genetic drift and mutations within diseased cells or to detect consuments method melecules within regulate expression of ERG such present nucleic acids, including antisense and ceryment may be no proposed to the expression of ERG such present nucleic acids, including antisense and ceryment conference of the present nucleic acids, including antisense and engance of the present nucleic acids, including antisense and engangement of the expression of the presence of ERG feed of the center of the presence of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Seguence 17 BP; 7 A; 1 C; 2 G; 7 U; 0 other;

Novel polymucleotide which down regulates expression of Ets-related gene, useful for treating cancer, diabetic retinopathy, macular degeneration, arthritis, psoriasis, verruca vulgaris and Sturge Weber syndrome

Claim 4; Page 85; 149pp; English.

The invention relates to a nucleic acid molecule (I) which down regulates expression of an Ets-related gene (ERG). (I) is useful for treating conditions selected from cancer, lymphoma, Ewing's sarcoma, melanoma, tumour angiogenesis, diabetic retinopathy, macular degeneration, tumour angiogenesis, diabetic retinopathy, macular degeneration, conditions edicated, myopic degeneration, arthritis, psoriasis, verruca vulgaris, angiofibroma of tuberous sclerosis, port-wine stains, Sturge Weber syndrome, Isukaemia, osteoporosis and wound healing. (I) is useful for syndrome, leukaemia, osteoporosis and wound healing. (I) is useful for treatment apatient having a condition suitable for the treatment. The method comprises the use of one or more therapies under conditions suitable for the treatment Leukaemia or tumour conjunction with one or more of other therapies such as radiation or conjunction with one or more of other therapies such as radiation or conjunction with one or more of other therapies such as radiation or cell, by conteating (I) is useful for reducing ERG activity in a cell, by conteating (I) with RNM, in the presence of a divalent cation such as Mg2+. (I) is useful for diagnosis of conditions and diseased to the expression of ERG, and as diagnostic tool to examine genetic drift and mutations within diseased cells or to detect the presence of ERG RNA in a cell. (I) is useful for specifically caramine genetic drift and mutations within diseased cells or to detect the presence of ERG RNA in a cell. (I) is useful for specifically caramine genetic drift and mutations within diseased cells or to detect the presence of ERG RNA in a cell. (I) is useful for specifically caramine genetic drift and mutations within RNG gene or ERG fusion genes. ABRI7354-ABR22719 represent nucleic acides, including antisense and catacted PCR primers of the invention.

```
The invention relates to a novel isolated 17 mer nucleic acid sequence, given in the specification, a sequence containing at least 15 consecutive nucleotides from the 17 mer sequence, a sequence, a sequence with, after optimal alignment, at least 80 % identity to the 17 mer sequence, a sequence that hybridizes to them under highly stringent conditions, or the complement of any of them, or the corresponding RNA. The novel isolated nucleic acids of the invention are useful as probes and primers for detecting, identifying, quantifying and/or amplifying a nucleic acid, e.g. as one component of a gene chip, in vitro as (anti)sense reagents, and for production of recombinant polypeptides. Any of the nucleic acids, polypeptides, vectors containing the nucleic acids, polypeptides, vectors containing the nucleic acids, cells containing the nucleic acids, cells containing the nucleic acids, preparation of pharmaceuticals for prevention and/or treatment of viral diseases that are characterised by development of tumours or cell degeneration, specifically cancer but also Alzheimer's disease and sching acids in patient samples is useful for diagnosis and/or prognosis of these diseases. The polypeptides can also be used to generate antibodies, and both the polypeptide and antibodies are useful as components of protein chips. The nucleic acid sequences of the invention can be used in gene therapy. This polymentical sequence represents a tumour suppression related human fukutin oligonucleotide of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Query Match 1.0%; Score 12.8; DB 1; Length 17; Best Local Similarity 87.5%; Pred. The invention relates to a novel isolated 17 mer nucleic acid sequence, given in the specification, a sequence containing at least 155 consecutive nucleotides from the 17 mer sequence, a sequence with, after potinal alignment, at least 80 % identity to the 17 mer sequence, a sequence, a sequence that hybridizes to them under highly stringent conditions, or the complement of any of them, or the corresponding RNA. The novel isolated nucleic acids of the invention are useful as probes and primers for detecting, identifying, quantifying and/or amplifying a nucleic acid, e.g. as one component of a gene chip, in vitro as [anti)sense reagents, and for production of recombinant polypeptides. Any of the nucleic acids, polypeptides, vectors containing the nucleic acids, cells containing the vector or antibodies directed against the polypeptides are useful for preparation of pharmaceuticals for prevention and/or treatment of viral diseases that are characterised by development of tumours or cell degeneration, specifically cancer but also Alzheimer's disease and experience of the expression of the patient samples is useful for diagnosis and/or prognosis of these diseases. The polypeptides can also be useful as components of protein chips. The nucleic acid sequences of the invention can be used in gene therapy. This polypubcide sequence of the invention and be used in gene therapy. This polymorelide sequence represents a tumour suppression
